

Anger

- **Somatic Signature:** A violent, instantaneous sympathetic redlining of the entire system. Breathing becomes deep, rapid, and sharp, or locks into a pressurized, heavy hold in the upper chest. Heart rate surges dramatically, creating a bounding, rhythmic pounding in the chest, carotid arteries, and ears as blood pressure spikes. Vasodilation shifts massive volume to the major skeletal muscle groups and the face, causing a burning internal heat. Muscular tone is intensely braced and coiled for kinetic impact—the jaw locks, the brow knits down, the fists clench, and the spine tethers forward, driving a direct, unblinking visual lock on the target.
- **Generative Mechanics:** The system detects an immediate, illegitimate barrier, threat, or boundary violation along its vector of intent. It occurs when an external agent or obstacle restricts the system's agency, compromises its territory, or violates a deeply held rule of engagement, provoking a sudden calculation that the resistance must be violently neutralized to preserve structural integrity.
- **Action Tendency:** High-velocity forward locomotion, direct kinetic confrontation, loud and low-frequency vocalization, and actions designed to physically dismantle, breach, or terrify the obstacle into submission.
- **Action Teleology:**
 - **Optimal Execution:** Serves as the ultimate boundary-enforcement and survival engine. By mobilizing maximum raw kinetic force and suppressing pain or fear responses in a fraction of a second, it allows the organism to violently repel predators, break through paralyzing constraints, and defend its vital resources or loved ones against predatory exploitation.
 - **Sub-Optimal Execution:** Blind, recursive destruction and structural self-sabotage. When executed without strict tactical control, the surge obliterates executive function and long-term predictive mapping. The system attacks indiscriminately, burning massive metabolic reserves, destroying critical alliance networks, and causing catastrophic, irreversible damage to its own perimeter over a passing or imagined friction.
- **Dissolution Criteria:** The complete neutralization, destruction, or definitive submission of the opposing obstacle; a sudden, overwhelming counter-threat that forces an emergency shift into survival panic; or the gradual metabolic exhaustion of the sympathetic surge as adrenaline reserves drain from the tissue.

Anticipation and Suspense

- **Somatic Signature:** High-velocity, forward-leaning up-regulation of the nervous system. Breathing is shallow, held at the top of the inhalation, or executed in rapid, quiet cycles to minimize internal acoustic noise. Heart rate is elevated and hyper-reactive, producing a distinct, pounding sensation in the chest and throat. Muscular tone is intensely coiled and primed for explosive action; the entire skeletal structure is slightly flexed, eyes are wide and locked on the primary vector of arrival, and the skin experiences a prickling, hyper-sensitized electrical charge.
- **Generative Mechanics:** The system isolates a highly significant, imminent event or outcome that is locked onto the immediate timeline but has not yet broken across the threshold of the

present moment. It occurs when the predictive engine has fully mapped the _arrival trajectory_ of a massive variable, but the _valence_ (catastrophic threat or massive resource windfall) remains unresolved, suspended in a state of high probability.

- **Action Tendency:** Total perceptual lock on the incoming vector, complete inhibition of non-essential metabolic functions (such as digestion or sleep induction), and an intense kinetic readiness to spring into immediate flight, defense, or acquisition the millisecond the threshold is crossed.
- **Action Teleology:**
- **Optimal Execution:** Minimizes systemic latency to absolute zero. By pre-loading the muscular and metabolic engines with raw fuel before the event occurs, it ensures the organism can react with instantaneous, maximum velocity the moment the variable manifests, gaining a critical fraction-of-a-second advantage in high-stakes environments.
- **Sub-Optimal Execution:** Chronically burns out the structural engine. If the state is maintained for extended intervals without resolution, the constant sympathetic redlining drains metabolic reserves, damages cellular tissue via prolonged cortisol and adrenaline exposure, fractures cognitive cohesion, and leaves the system jittery, exhausted, and brittle.
- **Dissolution Criteria:** The definite arrival and manifestation of the anticipated event—instantly converting the suspended potential into immediate defensive action, consumption, or baseline relief—or a structural collapse of the timeline that reliably removes the event from the horizon.

Awe

- **Somatic Signature:** A profound, breathless suspension localized in the chest and throat, accompanied by a distinct sensation of cool expansion throughout the upper torso. Breathing halts momentarily at the peak of a deep, silent inhalation, followed by an exceptionally slow, relaxed exhalation. Heart rate slows to a calm, resonant baseline with high parasympathetic tone. The jaw drops slightly, the eyes widen completely to maximize the visual field, and a wave of prickling, electrical chills (piloerection) ripples across the skin, particularly on the arms and back of the neck. The body feels small, lightweight, and completely anchored to the ground.
- **Generative Mechanics:** The system encounters an entity, space, or concept of such vast magnitude, complexity, or structural scale that it instantly transcends the current capacity of the internal predictive model. It occurs when the observer is forced to accommodate a reality that is grander than its existing cognitive architecture, prompting an immediate, voluntary downsizing of the self's perceived scale relative to the cosmos.
- **Action Tendency:** Absolute kinetic stillness, sustained and un-biased perceptual focus, and a total cessation of self-referential or transactional behaviors. The system is propelled to simply remain present, absorb data, and adjust its internal maps to match the vastness of the object.
- **Action Teleology:**
- **Optimal Execution:** Forces a radical, necessary expansion of the internal processing architecture. By shattering small, rigid models of reality and suppressing petty, self-

interested drives, it opens the system to massive cognitive upgrades, fosters profound collective alignment with the wider environment, and restores a balanced perspective on personal significance.

- **_Sub-Optimal Execution:** **_** Passive fixation or existential overwhelm. If the system is unable to process or ground the vastness of the data, the state can dissolve into a paralyzing, submissive quietism. The individual may become completely detached from immediate tactical survival, floating in a state of un-anchored wonder while ignoring urgent, real-world maintenance requirements.
- ****Dissolution Criteria:**** The gradual integration of the vast data into a updated, expanded internal map, a shift in attention back to local, immediate tasks, or the entry of a sharp threat vector into the perimeter that demands an instant return to defensive, self-preserves execution.

Boredom

- ****Somatic Signature:**** A heavy, draining lethargy paired with an undercurrent of restless, nervous agitation. Breathing is exceptionally slow, shallow, and punctuated by frequent, deep sighs that deflate the torso. Heart rate drops to a flat, sluggish baseline but remains hyper-reactive to brief distractions. Muscular tone is characterized by an un-anchored, slouching collapse—the spine slumps, the head rests heavily on the hands, and the limbs feel leaden, yet the fingers tap or the legs twitch rhythmically. The eyes glaze over, losing focus and drifting aimlessly across the room.
- ****Generative Mechanics:**** The system registers that the current environment or task contains zero high-utility data streams, novel variables, or actionable vectors for resource acquisition. It occurs when the processing engine is fully pre-loaded with energy but finds nothing in the local field that justifies the metabolic cost of execution, signaling that the current space is a dead zone for systemic growth.
- ****Action Tendency:**** Errant scanning, frequent shifts in body position, random task-switching, and an urgent propulsion to alter the immediate sensory field. The system is driven to abandon its current location or disrupt the status quo simply to provoke a data return.
- ****Action Teleology:****
- **_Optimal Execution:** **_** Acts as a vital migratory and evolutionary engine. By making prolonged stasis and low-utility environments intensely uncomfortable, it forces the organism to break out of comfort zones, seek out new territories, develop new skills, or innovate raw strategies during periods of absolute safety when survival is not actively threatened.
- **_Sub-Optimal Execution:** **_** Drifts into reckless, self-destructive stimulation-seeking. If the system cannot migrate or find constructive output, the intolerable friction can compel it to generate artificial crises—sabotaging stable relationships, engaging in high-risk behaviors, or consuming toxic inputs—just to escape the agony of processing a vacuum.
- ****Dissolution Criteria:**** The sudden introduction of a high-stakes variable or threat into the perimeter, the deliberate choice to engage in a highly complex, deeply challenging skill track, or a physical migration to a completely novel territory that demands active mapping.

Confusion

- **Somatic Signature:** A distinct, localized tension concentrated in the brow, eyes, and forehead, accompanied by an unsettling, un-centered flutter in the upper stomach. Breathing becomes irregular, shifting between brief, shallow holds and deep, frustrated exhalations. Heart rate exhibits a jagged, mildly elevated cadence. Muscular tone is characterized by an asymmetric bracing—the head tilts slightly, the eyes narrow or dart between points, and the hands may rise in tentative, open gestures. The global sensation is one of internal friction and cognitive heat.
- **Generative Mechanics:** The system encounters low-level, conflicting data streams or a minor, persistent breakdown in its localized predictive model. Unlike shock (which completely demolishes the map) or disorientation (which erases coordinates), confusion occurs when the map is present but contains mutually exclusive tracks or ambiguous variables (A and B are both true, but they cannot coexist).
- **Action Tendency:** A localized deceleration of all physical output, paired with a persistent, iterative scanning of the immediate problem. The system loops its attention back over the anomalous data points, testing connections and attempting to force the pieces into a logical architecture.
- **Action Teleology:**
- **Optimal Execution:** Serves as a vital error-correcting pause. By jamming the gears of forward execution, it prevents the system from acting on corrupted, incomplete, or flawed data. It forces the cognitive engine to slow down, isolate the specific logic gap, and verify the terrain before burning more energy on a false premise.
- **Sub-Optimal Execution:** Drifts into a recursive, exhausting processing loop. If the system lacks the necessary variables to resolve the paradox, it can become chronically stuck in a spinning-wheel state. This burns massive cognitive and metabolic reserves on an un-solvable knot, causing mental fatigue, frustration, and eventual executive burnout.
- **Dissolution Criteria:** Isolating the missing variable that bridges the contradiction, choosing a single track to test through immediate action (forcing a data return), or voluntarily abandoning the specific problem to restore baseline processing efficiency.

Contempt

- **Somatic Signature:** A sharp, asymmetrical tightening localized almost entirely on one side of the face and upper torso. Breathing is slight, controlled, and executed through a single, quiet nostril-flare or a brief, dismissive snort. Heart rate remains flat, cool, and unaffected by the target's presence. Muscular tone features a rigid, unilateral lift—the sneer pulls one corner of the lip upward, the chin tilts backward to force a downward gaze, and the shoulders rotate slightly away from the target, creating a physical stance of structural distancing.
- **Generative Mechanics:** The internal observer executes a definitive, top-down evaluation of an external agent, concluding that the target is fundamentally low-value, incompetent, or structurally useless to the collective hierarchy. It occurs when the predictive engine determines that the target has violated basic standards of functional capability or ethical

integrity, prompting a calculation that the target does not warrant the metabolic energy of anger or confrontation, but rather immediate exclusion.

- **Action Tendency:** Unilateral dismissal, cold mockery, eye-rolling, and physical withdrawal. The system is propelled to cut off all transactional loops with the target, treat their input as noise, and actively signal their diminished status to the wider network.

- **Action Teleology:**

- **Optimal Execution:** Serves as a vital hygiene and boundary-maintenance engine for the collective hierarchy. By cleanly deprioritizing low-value, parasitic, or corrupting elements without burning the metabolic fuel required for active warfare, it preserves the system's structural integrity, reinforces shared competence standards, and insulates the group from internal rot.

- **Sub-Optimal Execution:** Breeds blind arrogance and catastrophic tribal fracturing. If the evaluation is driven by unverified data or raw hubris, the system prematurely dismisses genuine external threats or ignores highly valuable corrective feedback from below, creating a brittle, isolated architecture that is entirely vulnerable to an unexpected counter-strike.

- **Dissolution Criteria:** The target executing a verifiable, undeniable demonstration of competence or structural utility that forces a re-indexing of their status; a complete physical or operational separation that removes the target from the system's territory entirely; or a collapse of the observer's own status that renders their judgment obsolete.

Curiosity

- **Somatic Signature:** A forward-leaning, highly focused up-regulation of the internal system. Breathing is quiet, steady, and light, minimizing internal noise to maximize external data collection. Heart rate is slightly elevated but remains fluid and stable, supplying an alert, bright energy to the brain. Muscular tone is characterized by an open, un-braced readiness—the head tilts, the torso leans slightly toward the object of focus, and the eyes widen, darting deliberately to track details. The internal sensation is a pleasant, driving warmth.

- **Generative Mechanics:** The system detects a localized gap in its predictive model, paired with a concurrent calculation that the missing information is both accessible and highly valuable. It occurs when an object, pattern, or environment presents a optimal ratio of the familiar to the unfamiliar, signaling a low-risk, high-reward opportunity to expand the system's map.

- **Action Tendency:** Active exploration, physical approach, manipulation of the object, and persistent tracking. The system is propelled to look behind, peer inside, dissect, or ask questions to extract the hidden data structure.

- **Action Teleology:**

- **Optimal Execution:** Expands the territory of the known and upgrades systemic fitness. By driving the organism to proactively seek out and master new variables during periods of relative safety, it builds an exceptionally robust, rich predictive map, ensuring the self is prepared for future environmental shifts before a crisis forces adaptation.

- **_Sub-Optimal Execution:** _ Reckless exposure to hidden hazards or major resource waste. If executed without proper perimeter tracking, the drive can compel the system to breach a safety boundary, stumble into a predatory nest, or burn massive energy stores investigating low-utility anomalies that yield zero return on investment.
- ****Dissolution Criteria:**** Exhausting the novel data stream and fully integrating the structural mechanics of the object into the internal map, or the sudden emergence of a higher-priority threat or resource vector that demands an immediate shift in focus.

Disorientation

- ****Somatic Signature:**** A sudden, floating suspension of bodily anchor points. Breathing becomes shallow, rapid, and un-centered; heart rate exhibits an irregular, fluttering rhythm. Muscular tone is characterized by a fluid, un-braced instability—knees feel soft, and the baseline vestibular orientation (balance) feels slightly uncoupled from the horizon. Eye movement becomes rapid and saccadic, shifting focus across the field of view without locking onto any single target.
- ****Generative Mechanics:**** The system experiences a massive, abrupt mismatch between its internal predictive model of space, time, or narrative context and the immediate environmental data. It occurs when the coordinate system the observer uses to track reality is scrambled, leaving the system temporarily unable to locate its current position on the map.
- ****Action Tendency:**** Instantaneous behavioral freezing, physical reaching or leaning toward solid structural anchors, and a frantic, multi-sensory scanning of the immediate surroundings to find a recognizable baseline.
- ****Action Teleology:****
- **_Optimal Execution:** _ Halts all forward kinetic output when navigating blind. By forcing an immediate stop, it prevents the organism from walking off a ledge, burning energy in the wrong direction, or executing catastrophic tactical errors based on an inverted map, preserving options until the data can be re-indexed.
- **_Sub-Optimal Execution:** _ Prolonged vertigo and systemic panic. If the system fails to re-establish a reliable baseline, the freezing response mutates into acute anxiety, fracturing executive function, causing motor clumsiness, and leaving the individual entirely vulnerable to ambient hazards due to sheer processing paralysis.
- ****Dissolution Criteria:**** Locating a single, immutable structural landmark (physical, logical, or temporal) that allows the internal observer to re-calibrate its coordinates and rebuild a coherent map of the current territory.

Dread

- ****Somatic Signature:**** Chronic, low-grade sympathetic tone paired with persistent muscular bracing. Sensation of a heavy, cold anchor or constriction in the upper abdomen and chest. Breathing is shallow and confined to the thoracic cavity; resting heart rate remains elevated without kinetic release. Persistent muscle tension locks the jaw, neck, and shoulders. Metabolic resources are steadily diverted away from digestion and repair, causing gastric sluggishness.

- **Generative Mechanics:** The system projects a high-probability, unavoidable future drop in safety, health, or resource baselines. Unlike fear, the trigger is non-localized and detached from the immediate sensory environment; it is an un-falsifiable countdown to an inevitable negative outcome on the timeline.
- **Action Tendency:** Hyper-vigilant scanning of the conceptual future, strict conservation of immediate physical energy reserves, and aggressive avoidance of any novel risks that might accelerate the timeline of depletion.
- **Action Teleology:**
- **Optimal Execution:** Serves as a defensive survival buffer. By treating the upcoming siege as a certainty, it forces the system to hoard resources, reduce exposure, and mentally simulate the worst-case scenario so it isn't caught flat-footed when the blow lands.
- **Sub-Optimal Execution:** The system burns massive metabolic reserves on a passive stakeout against a ghost. Because the threat is structural and prospective, the body remains in a toxic, non-kinetic holding pattern that erodes internal organs, causes sleep fragmentation, and paralyzes present-moment agency.
- **Dissolution Criteria:** The feared event finally occurs (shifting the system out of anticipation and into active crisis management), or the future timeline is definitively rewritten by a verifiable, structural alteration in the environment.

Embarrassment

- **Somatic Signature:** Sudden, intense vasodilation in the face, neck, and upper chest (blushing), creating an immediate sensation of localized, radiating heat. Heart rate surges with a rapid, fluttering rhythm; breathing becomes shallow and erratic, occasionally catching in the throat. The eyes immediately drop, breaking forward focus, while the head turns down and away. Muscular tone shifts to a clumsy, self-conscious stiffness as the body instinctively tries to shrink its physical footprint.
- **Generative Mechanics:** The system detects an acute, unexpected rupture in its public presentation. It occurs when a sudden behavioral error, physical mishap, or un-curated exposure reveals a stark discrepancy between how the individual intends to be perceived and the immediate feedback of the surrounding audience, shattering the local social mask.
- **Action Tendency:** Instantaneous behavioral braking, concealment of the face, nervously laughing or smiling, and an urgent desire to physically withdraw or hide from the direct line of sight of the observers.
- **Action Teleology:**
- **Optimal Execution:** Serves as an immediate social repair mechanism. By broadcasting a visible, involuntary signal of distress and alignment with the group's standards, it disarms potential judgment or hostility from the audience, demonstrating that the individual recognizes the mistake and respects the shared social boundary.
- **Sub-Optimal Execution:** Paralyzes present-moment execution. The intense internal focus on the rupture can cause a feedback loop of clumsy motor errors, conversational freezing, or a complete

loss of composure, turning a minor, passing friction into a prolonged performance collapse that erodes social efficacy.

- ****Dissolution Criteria:**** An explicit, reassuring gesture from the audience (such as shared laughter or validation) that closes the rupture, a rapid, successful re-curation of the public mask, or physical removal from the presence of the witnesses.

Envy

- ****Somatic Signature:**** A sharp, burning constriction localized in the upper stomach, chest, and throat. Breathing is tight and shallow, held in the upper lungs with an irregular cadence. Heart rate spikes with a jagged, high-velocity rhythm, causing a flash of systemic heat. Muscular tone is intensely braced, particularly in the jaw, fists, and core, creating an internal feeling of bitter, compressed friction.
- ****Generative Mechanics:**** The system witnesses a peer—someone categorized as a structural equal within the local hierarchy—possessing a high-value resource, trait, or status that the self lacks. This creates an immediate, severe distortion on the internal observer's assessment of relative rank and fitness, signaling a sudden, uncompensated deficit.
- ****Action Tendency:**** Hyper-focused tracking of the target's advantages and vulnerabilities, paired with a powerful kinetic drive to either bridge the resource gap through acquisition or actively diminish the target's status, reputation, or possession.
- ****Action Teleology:****
 - **_Optimal Execution:_** Acts as a harsh, non-negotiable motivator for survival and rank maintenance. By causing severe internal discomfort at the sight of an equal's advancement, it forces the system out of complacency, driving it to compete harder, upgrade its own skills, or secure critical resources it would have otherwise neglected.
 - **_Sub-Optimal Execution:_** The friction curdles into malicious sabotage or paralysis. Instead of generating self-directed utility, the system spends massive cognitive and relational reserves on covertly tearing down the peer. This burns valuable social credit, destroys cooperative networks, and leaves the individual bitter, stagnant, and blind to their own development.
- ****Dissolution Criteria:**** Acquiring an equivalent or superior resource/status to restore systemic balance, witnessing the target lose the contested advantage (collapsing the comparison), or structurally shifting the self into an entirely different hierarchy where the target is no longer a relevant peer.

Excitement and Arousal

- ****Somatic Signature:**** Acute, high-velocity sympathetic activation. Breathing accelerates and shifts to the upper chest; heart rate surges, delivering an internal sensation of expansion or bounding pulses in the throat and chest. Muscular tone is highly primed, presenting as a bouncy lightness, a forward-leaning posture, and a mild tremor in the extremities. Peripheral vision sharpens, pupils dilate, and skin temperature rises, often accompanied by flushing or a prickling sensation.
- ****Generative Mechanics:**** The system detects an imminent, high-probability reward or a

massive, positive environmental shift. It occurs when a long-standing seeking loop is on the verge of a successful, high-yield closure, or when a novel, highly attractive variable enters the immediate field.

- **Action Tendency:** Rapid forward movement, vocalization, and high-impact engagement with the environment. The system is propelled to close the physical or conceptual distance between itself and the target, accelerating its processing speed to seize the incoming opportunity.

- **Action Teleology:**

- **Optimal Execution:** Supercharges the system for immediate, high-efficiency execution. By flooding the body with neurochemicals that dull pain and fatigue, it ensures the organism has the raw power, speed, and focus required to capture a fleeting resource or secure a critical evolutionary victory.

- **Sub-Optimal Execution:** Overdrive blinds the observer to risk and detail. The system suffers from severe tunnel vision, overlooking structural flaws, ignoring concurrent threats, and burning massive amounts of energy on reckless, uncoordinated leaps before the reality of the situation is fully verified.

- **Dissolution Criteria:** The capture and consumption of the reward (moving the system into satiation), the sudden withdrawal or destruction of the target (shifting the system into frustration or melancholy), or the natural metabolic exhaustion of the neurochemical surge over time.

Exhaustion and Burnout

- **Somatic Signature:** Deep, systemic down-regulation across both the sympathetic and parasympathetic branches. Breathing is shallow and flat; resting heart rate may remain abnormally elevated or stubbornly resistant to exertion. Heavy, leaden muscular tone dominates the limbs, paired with chronic neural fatigue, cognitive fog, and a blunted sensory apparatus. The gut is often sluggish, and the internal temperature regulation feels erratic, frequently leaning toward a cold chill.

- **Generative Mechanics:** Chronic, un-resolvable spending of metabolic, cognitive, or nervous reserves without adequate recovery intervals. The internal system has run its operational budgets into a severe deficit, triggering an involuntary systemic circuit breaker to halt further resource depletion.

- **Action Tendency:** Total behavioral flatline and withdrawal. The system drops its responsiveness to both threats and rewards, ignoring external cues that would normally trigger panic or desire, and seeks absolute immobility and isolation.

- **Action Teleology:**

- **Optimal Execution:** Acts as an emergency preservation mechanism. By rendering the system numb to external demands, it forces a cessation of the catastrophic spending loop, saving the organism from permanent structural, neural, or organ damage through non-negotiable stasis.

- **Sub-Optimal Execution:** When the system drops its defenses completely while in a high-risk environment, it leaves itself dangerously exposed. The flatline state can freeze necessary

survival behaviors, causing the individual to abandon vital social roles, ignore critical maintenance requirements, and sink into a long-term, non-adaptive vegetative low-power mode.

- **Dissolution Criteria:** An extended period of zero-demand rest paired with biochemical restoration, or a severe, unmistakable existential threat that overrides the circuit breaker via an adrenaline surge to force a final, desperate survival effort.

Fear

- **Somatic Signature:** Acute, violent sympathetic nervous system spike (the classic fight-or-flight response). Blood is instantly shunted from the viscera and skin to the large skeletal muscles, causing a cold sweat, sudden paleness, and a dropping sensation in the stomach. Breathing freezes or becomes rapid and shallow; heart rate skyrockets. Muscular tone is intensely coiled, primed for explosive kinetic output or total immobility (freezing).
- **Generative Mechanics:** The immediate detection of a localized, unambiguous, and present threat to the system's physical integrity or immediate survival. The danger is right here, right now, requiring no cognitive projection to decode.
- **Action Tendency:** Instantaneous evasion, flight, or explosive self-defense. If movement is calculated as impossible or counterproductive, the system defaults to absolute immobility to avoid detection.
- **Action Teleology:**
 - **Optimal Execution:** Minimizes reaction time to zero through subconscious, reflexive overriding of the deliberate mind. It maximizes the immediate structural survival of the organism by using raw kinetic force to escape or neutralize a lethal threat.
 - **Sub-Optimal Execution:** Panic causes catastrophic motor errors, blind rushing into greater danger, or a total freezing response when movement is the only viable escape route. It overrides rational environmental assessment, treating benign variables as lethal threats.
- **Dissolution Criteria:** The complete removal, destruction, or outrunning of the threat, allowing the sympathetic surge to break and clear through shivering or trembling as the system resets.

Guilt

- **Somatic Signature:** A localized, gnawing knot or heavy pressure concentrated in the upper stomach and solar plexus. Breathing is uneven, frequently punctuated by sharp, silent intakes or shallow holds. Heart rate exhibits an uncomfortably tight, thumping rhythm that fluctuates with thought patterns. Muscular tone is characterized by an internal, agitated bracing—especially in the gut and hands—while the external posture remains functional but subtly constricted.
- **Generative Mechanics:** The internal observer registers a specific, clear violation of its own ethical architecture or code of conduct. Unlike shame, which targets the entire identity, guilt focuses strictly on a discrete action or omission (\$X\$ occurred, and I caused it). It is the friction of knowing one's behavior has directly damaged an external entity, a relationship, or a shared boundary.

- **Action Tendency:** A powerful, restless drive toward kinetic repair, confession, restitution, and the direct undoing of the damage caused. The system is propelled toward the object of the violation to balance the internal ledger.
- **Action Teleology:**
 - **Optimal Execution:** Serves as the primary maintenance engine for structural integrity and social cohesion. By generating persistent, localized discomfort following a transgression, it forces the system to take immediate responsibility, repair broken loops, and pay the necessary energy or resource cost to restore trust and equilibrium within the environment.
 - **Sub-Optimal Execution:** Mutates into chronic, non-productive self-flagellation. If the damage is truly irreversible, or if the system cannot find a path to restitution, the energy becomes trapped in a recursive loop. The individual burns massive metabolic and cognitive reserves punishing themselves over a static point on the timeline, paralyzing present-moment utility without altering the past.
 - **Dissolution Criteria:** Executing a verifiable act of restitution or repair that balances the ledger, receiving explicit forgiveness or absolution from the damaged entity, or completing a structured, internal penance that satisfies the observer's ethical code.

Happiness

- **Somatic Signature:** A systemic, fluid up-regulation characterized by deep, rhythmic parasympathetic dominance. Breathing is full, effortless, and centered broadly across the entire torso; heart rate is strong, steady, and exhibits high variability, signaling a state of low internal stress. Muscular tone is characterized by a global un-bracing—the jaw relaxes, the hands open, the shoulders drop completely away from the neck, and the facial muscles soften into an easy, symmetrical presentation. A warm, lightweight sensation radiates outward from the solar plexus to the periphery.
- **Generative Mechanics:** The internal observer registers a comprehensive realization of structural safety, optimal resource levels, or the successful execution of a core life strategy. It occurs when the predictive engine detects a prolonged absence of critical threats paired with an active influx of high-utility environmental rewards, signaling that the current territory is highly stable and favorable to the self.
- **Action Tendency:** Prosocial engagement, broad environmental exploration, creative play, and the spontaneous sharing of excess resources. The system drops its defensive armor, lowers its scanning for threats, and leans directly into present-moment consumption and relational bonding.
- **Action Teleology:**
 - **Optimal Execution:** Serves as the primary recovery and stabilization engine for the organism. By lowering cortisol and adrenaline baseline levels, it facilitates deep cellular repair, optimizes immune and digestive functioning, and strengthens social alliances through shared vulnerability and play, building a resilient reserve capacity for future crises.
 - **Sub-Optimal Execution:** Drifts into passive complacency and a dangerous lack of vigilance. If the state becomes a permanent, uncritical baseline irrespective of changing conditions, the system ignores subtle threat vectors, neglects necessary boundary maintenance, and fails to

gather the resource buffers required to survive the inevitable return of environmental hardship.

- **Dissolution Criteria:** The natural metabolic attenuation of the neurochemical reward over time, the direct entry of a sharp threat or deficit vector into the perimeter, or a shift in focus toward a new, uncompleted goal that demands an immediate return to high-alert, sympathetic exertion.

Hope

- **Somatic Signature:** A distinct, forward-facing lift localized in the upper chest and eyes, accompanied by a quiet, stabilizing warmth throughout the core. Breathing is deep, steady, and unhurried, providing a consistent supply of oxygen to the system. Heart rate is calm but firm, maintaining a reliable cadence that supports sustained physical endurance. Muscular tone is characterized by a resilient, flexible readiness—the spine elongates, the chin lifts slightly, and the hands remain un-clenched and open to the environment. The global sensation is one of lightweight buoyancy defying immediate gravity.
- **Generative Mechanics:** The internal observer projects a highly valuable, favorable outcome onto a distant, currently inaccessible timeline. It occurs when immediate environmental data indicates a severe deficit, pain, or structural friction, but the predictive engine isolates a valid pathway or a high-probability shift toward future restoration, enabling the system to de-link its current metabolic morale from its immediate, bleak surroundings.
- **Action Tendency:** Sustained preservation of resources, persistent endurance through current hardship, and steady, incremental movement along a long-term trajectory. The system actively resists the impulse to drop into catatonic stasis or surrender its agency to the present deficit.
- **Action Teleology:**
 - **Optimal Execution:** Serves as the ultimate engine for systemic endurance and long-term survival. By supplying a steady, low-grade stream of metabolic resilience, it allows the organism to tolerate prolonged cold, isolation, or structural oppression without dropping into existential collapse, keeping the system intact until the environmental winter passes and conditions improve.
 - **Sub-Optimal Execution:** Mutates into passive, delusional quietism. If the projected future triumph is entirely decoupled from practical reality and requires zero immediate action, the individual remains frozen in a destructive environment, wasting vital time waiting for a magical rescue while neglecting urgent, real-world maintenance or necessary tactical retreats.
- **Dissolution Criteria:** The definite arrival and manifestation of the projected positive reality (converting hope into present-moment consumption); the complete, verified closure of the future pathway, causing a structural collapse into sadness; or a sudden, localized emergency that demands an instant return to immediate survival execution.

Humiliation

Humiliation

- **Somatic Signature:** A crushing, violent compression localized in the chest and solar plexus, paired with a freezing cold sensation in the extremities. Breathing is choked, restricted, or completely held; heart rate spikes into a erratic, pounding rhythm. The head is forcibly bent downward, the spine slumps, and the gaze is pinned to the floor, yet the jaw, neck, and fists remain locked in a white-knuckled, impotent bracing pattern. The face may alternate between a burning flush of rage and a deathly pale mask of exposure.
- **Generative Mechanics:** An external agent forcibly and publicly strips away the system's status, dignity, or bodily autonomy in front of witnesses. It is the absolute destruction of the social mask combined with the complete removal of the power to defend it, exposing the naked self to collective degradation.
- **Action Tendency:** Total behavioral immobilization and structural collapse in the moment, paired with an intense, burning undercurrent of relational anger and a desperate urge to vanish from reality.
- **Action Teleology:**
 - **Optimal Execution:** Serves as a catastrophic, final survival brake. By forcing the system into absolute, public submission, it halts further kinetic violence or total annihilation from an overwhelmingly dominant force, preserving bare physical life at the absolute bottom of the hierarchy.
 - **Sub-Optimal Execution:** Traps the system in a permanent state of existential devastation. The experience shatters the internal observer's model of self-worth, curdling into a chronic, toxic obsession with vengeance or an absolute withdrawal from all human contact, paralyzing the individual's long-term capacity for agency and development.
- **Dissolution Criteria:** The complete destruction or definitive submission of the agent who inflicted the blow, a profound public restoration of honor by a higher authority, or a total psychological death-and-rebirth process that entirely detaches the individual's baseline identity from that specific social landscape.

Indignation

- **Somatic Signature:** A sudden, hot expansion localized in the chest and throat, accompanied by an immediate rise in blood pressure. Breathing becomes deep, rapid, and sharp; heart rate surges with a strong, full pulse. Muscular tone locks into an erect, dominant posture—the spine straightens, the chin lifts, the shoulders square, and the brow knits firmly. There is a total absence of fear-based trembling; the body feels structurally solid and charged with clean kinetic potential.
- **Generative Mechanics:** The system witnesses the explicit violation of a shared, internalized social contract, rule, or boundary by an external agent. Crucially, the violation does not need to cause direct physical or material harm to the self; it is triggered purely by the structural breach of order within the collective framework.
- **Action Tendency:** Loud vocalization, public denunciation, and forward movement to confront the violator. The system is propelled to intervene, expose the transgression, and rally the surrounding group to enforce compliance or extract a penalty.

- **Action Teleology:**
- **Optimal Execution:** Preserves the integrity and stability of the collective network. By weaponizing personal energy to defend an abstract rule, it deters predatory or parasitic behavior within the group, enforces structural fairness, and ensures that the shared boundaries holding the tribe together do not decay.
- **Sub-Optimal Execution:** Mutates into self-righteous tyranny or blind fanaticism. The system can mistake its personal preferences or rigid interpretations for absolute laws, over-penalizing minor infractions, fracturing social cohesion over semantic disputes, and burning valuable relational credit on aggressive crusades that produce no real systemic utility.
- **Dissolution Criteria:** The violator acknowledges the breach and yields to the standard (via apology, submission, or payment of a penalty), the surrounding group steps in to collectively enforce the rule, or the self physically removes itself from the compromised social system, abandoning the broken framework entirely.

Isolation

- **Somatic Signature:** A stark, desensitized numbness throughout the body, accompanied by a flat, uniform coldness in the extremities. Breathing is exceptionally low-volume and mechanical; heart rate remains stuck at a rigid, low-variability baseline. The body lacks muscular bracing but feels completely un-anchored, as if its physical boundaries are dissolving into the surrounding space. Sensory processing shifts to an analytical, hyper-focused track, stripping away the emotional texture of ambient sights and sounds.
- **Generative Mechanics:** The system experiences the total, structural removal of a protective social perimeter or tribal network. It is triggered by concrete physical displacement, the absolute severing of communication channels, or an structural exile that leaves the individual entirely independent and exposed to the raw mechanics of the environment.
- **Action Tendency:** Stark self-reliance, total behavioral containment, and a shift toward meticulous, mechanical management of immediate physical variables. The system drops all social-signaling behaviors (facial expressions, vocal inflections) to conserve baseline resources.
- **Action Teleology:**
- **Optimal Execution:** Minimizes systemic friction in the absence of a group. By shutting down the high-energy social mind and turning off the demand for external validation, it allows the individual to operate with cold, clinical efficiency, maximizing tactical survival and environmental manipulation when no backup is coming.
- **Sub-Optimal Execution:** Drifts into systemic de-realization and existential rot. Without the mirroring feedback of a human group to anchor reality, the internal observer's conceptual framework begins to scramble, causing a decay in executive functioning, the loss of temporal tracking, and a slow surrender to baseline entropy.
- **Dissolution Criteria:** Re-entering a verifiable, structured territory controlled by a non-hostile group, or establishing a reliable, objective communication link that restores the system's position within a wider network.

Jealously

- **Somatic Signature:** A sharp, burning heat concentrated in the upper stomach and chest, paired with a cold, prickly hyper-vigilance across the skin. Breathing is shallow, fast, and tightly controlled to maintain sharp sensory focus. Heart rate surges into an erratic, pounding sympathetic rhythm that spikes at the slightest shift in the environment. Muscular tone is intensely braced, presenting an un-centered, volatile readiness—the jaw tethers, the neck stiffens, the eyes narrow into a laser-like lock on the target and rival, and the hands frequently clench or twitch with restless kinetic energy.
- **Generative Mechanics:** The system detects an active threat of interception regarding a critical, currently possessed relational resource or bond. It occurs when the predictive engine registers that a third-party rival is initiating a transaction designed to extract, degrade, or divert the fidelity of an essential structural anchor, threatening the self with immediate displacement and resource loss.
- **Action Tendency:** Intense, hyper-vigilant surveillance of the partner and rival, aggressive boundary enforcement, constant monitoring of communication vectors, and territorial locking behaviors designed to physically or psychologically insulate the resource from external access.
- **Action Teleology:**
 - **Optimal Execution:** Serves as a high-alert protective sentinel for vital structural alliances. By instantly triggering deep discomfort and hyper-focus at the first subtle indicator of defection or external intrusion, it forces the system to proactively fortify its relational boundaries, disrupt rival incursions, and defend the integrity of pairs or tribes essential for long-term stability.
 - **Sub-Optimal Execution:** Paranoiac, self-fulfilling destruction of the bond. If the threat calculation is distorted or driven by unverified data, the constant, suffocating surveillance, erratic outbursts, and aggressive boundary-tightening burn through the relational capital of the alliance, driving the partner away and manufacturing the exact abandonment the system was trying to prevent.
- **Dissolution Criteria:** The definitive removal or neutralization of the competing rival vector; a comprehensive, verifiable re-establishment of safety and fidelity from the partner that satisfies the predictive engine; or a complete structural severing of the bond, converting the state into sadness or anger.

Loneliness

- **Somatic Signature:** A distinct, hollow ache or cold constriction localized in the center of the chest and throat, often described as a visceral "hunger" that food cannot appease. Breathing is sigh-heavy and restricted to the upper chest; heart rate can show a brittle, hyper-reactive baseline. The body experiences a subtle, chronic chill, accompanied by a general heaviness in the limbs and a hyper-alertness to ambient environmental sounds.
- **Generative Mechanics:** The internal system detects a lack of reciprocal, intimate social bonds and emotional alignment. It is not triggered by mere physical solitude, but by a relational mismatch—the realization that the individual's internal state is completely unmapped

by and hidden from the surrounding group.

- **Action Tendency:** Hyper-vigilant scanning of the social horizon for signs of acceptance or rejection, paired with a paradoxical urge to socially retreat to protect the exposed, aching self from further friction.
- **Action Teleology:**
 - **Optimal Execution:** Serves as a vital relational alarm. By generating intense psychological and physical discomfort, it drives the individual to abandon superficial interactions, seek out deep alignment, and reinvest energy into building robust, reciprocal bonds that secure their place in a shared circle.
 - **Sub-Optimal Execution:** The chronic ache mutates into social paranoia. The system begins to view all proximity with suspicion, misinterprets benign social cues as active rejections, and either smothers others with desperate demands for validation or entirely freezes its social output, locking itself in a self-perpetuating vacuum.
- **Dissolution Criteria:** The experience of a shared, mutual vulnerability with another entity, where the internal observer verifies that its state is accurately witnessed, understood, and accepted by a peer.

Melancholy

- **Somatic Signature:** A systemic deceleration and low-power mode. Sensation of a uniform, hollow weight throughout the entire body, accompanied by slow, shallow diaphragmatic breathing and a lowered resting heart rate. Muscular tone is soft and unbraced, leaning toward slouching or stillness. Sensory processing drops in volume—sounds feel distant, and visual focus becomes soft and unfixed (gazing into space).
- **Generative Mechanics:** The internal system initiates a spontaneous metabolic audit, detecting a diffuse, un-localized depletion of long-term meaning, vitality, or environmental connection. Unlike sadness, it is not triggered by a specific, acute loss; it is an organic down-regulation when the current landscape no longer yields systemic nourishment.
- **Action Tendency:** Stillness, introspection, and behavioral deceleration. The system resists taking on new tasks, pulls back from active social engagement, and drifts into recursive, abstract reflection.
- **Action Teleology:**
 - **Optimal Execution:** Protects the system from wasting energy on meaningless loops. By slowing down the machine, it allows for deep, unconscious restructuring of priorities, values, and frameworks, ensuring that when the system accelerates again, it moves toward genuine utility.
 - **Sub-Optimal Execution:** Can lock the system into a self-perpetuating, low-energy orbit. If left un-channeled, it ossifies into chronic apathy, where the individual stops feeding necessary biological and relational loops, mistaking a temporary wintering phase for a permanent reality.
- **Dissolution Criteria:** The gradual, organic completion of the internal cognitive restructuring, or an unexpected, high-salience shift in the environment that offers an

undeniable hook for action.

Morose

- **Somatic Signature:** A heavy, sour constriction localized in the chest, throat, and lower jaw. Breathing is heavy, punctuated by deep, audible exhalations or sighs. Muscular tone is rigid yet collapsed—shoulders rolled forward, head down, brow knitted in a down-turned set. Peripheral circulation drops, creating a cold, damp internal feeling.
- **Generative Mechanics:** Triggered by a specific, identifiable setback, grievance, or loss that the system feels completely powerless to change, yet refuses to accept. It is the toxic pairing of systemic defeat with unexpressed internal friction.
- **Action Tendency:** Active withdrawal paired with sullen resistance. The system broadcasts non-cooperation through silence, deliberate clumsiness, or abrupt rejections of comfort and social contact.
- **Action Teleology:**
 - **Optimal Execution:** Serves as an unambiguous social boundary marker. By projecting a hostile, unapproachable state, it keeps others at a distance, securing a temporary perimeter to process a bitter defeat without having to maintain a public face or expend energy on politeness.
 - **Sub-Optimal Execution:** It poisons the immediate social environment. The passive-aggressive projection pushes away genuine support systems, burns useful social credit, and traps the individual in a bitter, repetitive mental cycle that prioritizes nursing the grievance over adapting to the new reality.
- **Dissolution Criteria:** A direct acknowledgment of the grievance by the external environment, a sudden spike of anger that converts the passive bile into active confrontation, or the conscious surrender of the unrecoverable position.

Pride

- **Somatic Signature:** Clean, expansive up-regulation of the internal system. Breathing is deep, steady, and centered in the chest; heart rate is strong, stable, and calm. Muscular tone is characterized by an erect, effortless posture—the spine straightens, the chest expands, the shoulders drop back and down, and the chin lifts slightly. The gaze is direct, stable, and forward-facing. There is a global sensation of physical solidity and internal heat.
- **Generative Mechanics:** The internal observer verifies a highly successful alignment between the self and a standard of excellence. This occurs when the system registers a significant achievement, a display of high-level mastery, or a position of high relative value within its domain, signaling a secure or elevated placement in the architecture of reality.
- **Action Tendency:** Broad territorial presence, open and un-braced physical presentation, and a willingness to be seen and evaluated. The system leans toward forward movement, clear vocalization, and steady social engagement without the need for defensive shielding.
- **Action Teleology:**
 - **Optimal Execution:** Locks in and reinforces high-utility behaviors. By delivering a profound

internal reward, it marks the strategies, efforts, and disciplines that led to success, anchoring them in the system's architecture so they can be repeated. It also signals competence to the environment, establishing a clear baseline of capability.

- **_Sub-Optimal Execution:** _ Drifts into systemic blindness and structural rigidity. If the state detaches from real-world execution and becomes a permanent, un-falsifiable self-evaluation, the system stops gathering critical feedback, ignores mounting vulnerabilities, treats peers with unearned dismissal, and sets itself up for a catastrophic collision with reality.
- ****Dissolution Criteria:**** The natural attenuation of the neurochemical reward over time, a voluntary shift in focus to a new, unmastered frontier that exposes a fresh deficit, or a direct, objective failure that contradicts the internal model of superiority.

Regret

- ****Somatic Signature:**** A heavy, localized ache concentrated directly behind the sternum, paired with a sudden, sinking vacuum in the pit of the stomach. Breathing is restricted, characterized by sudden, shallow holds or long, bitter exhalations that leave the lungs deflated. Heart rate drops into a flat, restricted, and tight cadence. Muscular tone is marked by a tight, protective drawing-inward of the upper torso—the head bows, the brow locks into a deep, downward knot, and the hands may repeatedly cover the face or press against the chest.
- ****Generative Mechanics:**** The internal observer initiates a retrospective counterfactual simulation, projecting an alternate timeline where a different personal choice would have yielded a massively superior outcome. It occurs when a current deficit or failure is definitively traced back to a specific node of past agency, forcing the predictive engine to recognize that the self was the primary author of its own misfortune.
- ****Action Tendency:**** Repetitive, circular cognitive tracking of the decision node, behavioral deceleration in the present, and internal vocalization of self-blame. The system is propelled to mentally re-play the error over and over, analyzing the precise failure points.
- ****Action Teleology:****
 - **_Optimal Execution:** _ Serves as a powerful, high-impact error-correcting mechanism. By generating an intensely painful somatic penalty around a specific past choice, it forcefully updates the predictive engine's decision-making algorithms, ensuring that the structural mechanics of the strategic error are deeply encoded so the system never executes that specific failure path again.
 - **_Sub-Optimal Execution:** _ Paralyzing, recursive self-flagellation. If the system remains locked in the counterfactual simulation without translating the data into present-moment parameters, the state hardens into a toxic loop. The individual burns massive cognitive energy mourning an un-alterable past, completely destroying current agency and leading to chronic executive stagnation.
 - ****Dissolution Criteria:**** The definitive extraction of the strategic lesson, followed by a deliberate shift in focus toward immediate, actionable choices in the present territory; or the passage of time rendering the consequences of the past decision structurally irrelevant to current survival.

Resentment

- **Somatic Signature:** A chronic, low-grade sympathetic burn paired with persistent muscular bracing. Sensation of bitter, compressed heat or heavy constriction locked tightly in the jaw, neck, and shoulders. Breathing is shallow, restricted to the upper chest, and punctuated by tight, clipped exhalations. Heart rate exhibits an elevated, low-variability baseline. Metabolic energy is steadily drawn away from digestion and internal repair, leading to systemic tension and a sour acidity in the stomach.
- **Generative Mechanics:** The system detects an ongoing, unfair distribution of resources, labor, or status relative to a peer, paired with a concurrent calculation that direct, overt confrontation is too costly, dangerous, or socially prohibited. It is the toxic accumulation of a structural grievance that the self feels powerless to correct through open force.
- **Action Tendency:** Passive-aggressive resistance, covert non-compliance, hyper-vigilant tracking of the target's failures, and the secretive hoarding of small pieces of relational leverage. The system leaks defiance through silent withdrawal or subtle sabotage while maintaining a compliant surface presentation.
- **Action Teleology:**
 - **Optimal Execution:** Serves as an internal ledger and energy-conservation strategy. By preventing the system from burning its resources on a losing, immediate fight, it keeps the organism alert to long-term structural shifts, preserving the memory of the injustice until a time when the balance of power changes and the debt can be safely collected.
 - **Sub-Optimal Execution:** The unexpressed kinetic energy turns inward, causing severe systemic wear. Because the grievance has no open outlet, it poisons present-moment agency, destroys the capacity for genuine cooperation, misdirects friction onto innocent third parties, and drains metabolic reserves on a permanent, bitter stakeout.
- **Dissolution Criteria:** An explicit, structural redistribution of the contested resource or status, a successful overt confrontation once sufficient leverage is acquired, or a complete severance of the social relation, rendering the comparison entirely irrelevant.

Restlessness and Agitation

- **Somatic Signature:** Hyper-activation of the sympathetic nervous system without a fixed kinetic outlet. Features include shallow, rapid upper-chest breathing; localized muscular tension (often presenting as twitching, fidgeting, or shifting weight in the limbs, and a clenched jaw); elevated heart rate; and an internal sensation of buzzing or pressure. The eyes frequently shift focus, seeking a point of stabilization.
- **Generative Mechanics:** A buildup of internal potential energy occurs without a clear external object or directed path for execution. This is triggered by a sudden cessation of physical output, a perceived drop in environmental stimulation, or an underlying metabolic surplus that the current behavioral framework cannot absorb.
- **Action Tendency:** Unfocused kinetic movement and random environmental manipulation. The system is forced into pacing, drumming fingers, altering its immediate physical position, or initiating low-yield exploratory tasks just to burn off the energy surplus.

- **Action Teleology:**
 - **Optimal Execution:** Forces the organism out of stagnation and stasis. By inducing physical discomfort during periods of inactivity, it drives the system to explore the environment, uncover new opportunities, or modify its current space, ensuring it does not become a sitting target or miss hidden resources.
 - **Sub-Optimal Execution:** When the energy cannot be channeled into structured action, it degrades into erratic, hyper-reactive behavior. The system begins to create artificial problems, picks unnecessary fights with its immediate environment or companions, and wastes vital metabolic reserves on empty, circular movements.
- **Dissolution Criteria:** The identification of a high-value, concrete task or threat that locks the system into a directed action loop, or the deliberate depletion of the physical energy surplus through intense, sustained kinetic output.

Sadness

- **Somatic Signature:** A heavy, crushing down-regulation centered entirely in the chest and throat, paired with a hollow, aching vacuum in the stomach. Breathing is shallow, erratic, and disrupted by involuntary, sharp diaphragmatic spasms (sobbing) or deep, long sighs that drain the remaining air from the lungs. Heart rate is thin, slow, or tightly restricted. Muscular tone undergoes a global, gravity-heavy collapse—the head drops, the shoulders round forward around the sternum, the limbs feel weighted down with lead, and the eyes burn or overflow with fluid, losing their sharp, forward focus.
- **Generative Mechanics:** The internal observer registers a definitive, irreversible loss of a critical structural anchor, resource, or relational bond. It occurs when the predictive engine updates the map of reality and realizes that a massive source of systemic stability or meaning is permanently gone, rendering all previous action strategies oriented around that anchor completely obsolete.
- **Action Tendency:** Total behavioral deceleration, social withdrawal, and physical immobilization. The system is propelled to curl inward, drop all ongoing kinetic projects, and remain entirely still, refusing to allocate energy to the external environment.
- **Action Teleology:**
 - **Optimal Execution:** Serves as an essential metabolic and psychological containment field. By forcing an immediate, low-energy shutdown, it prevents the organism from wasting precious resources on hopeless, impossible attempts to recover what is permanently lost. It creates a protected internal space for the painful, necessary work of rewriting the entire map of reality and reconstructing the self-model around a diminished baseline.
 - **Sub-Optimal Execution:** Mutates into chronic, catatonic depression. If the system refuses to accept the data update or lacks the structural resilience to rewrite its map, the low-energy state becomes permanent. The individual remains trapped in a recursive loop of despair, completely paralyzing baseline agency, destroying metabolic efficiency, and leading to total existential decay.

- ****Dissolution Criteria:**** The completion of the internal map-restructuring process, allowing the system to accept the new baseline reality, followed by the slow, tentative emergence of a new actionable vector or anchor point that restores forward kinetic energy.

Satiation and Contentment

- ****Somatic Signature:**** Global down-regulation of the sympathetic nervous system. Parasympathetic dominance triggers deep, slow diaphragmatic breathing, general muscular relaxation (particularly in the facial muscles, jaw, and hands), and increased gastric motility (digestion). Core body temperature feels warm and stable; peripheral circulation increases. There is a complete absence of kinetic urgency or scanning behaviors.
- ****Generative Mechanics:**** All immediate biological and systemic feedback loops (such as caloric intake, thermal regulation, hydration, and physical safety) are temporarily closed. The internal system registers a net-neutral or net-positive balance sheet with zero immediate deficits.
- ****Action Tendency:**** Quiescence and preservation of the current state. The organism ceases environmental tracking, exploratory foraging, and status negotiation, opting instead for physical stillness or low-energy maintenance behaviors (e.g., grooming, resting).
- ****Action Teleology:****
 - **_Optimal Execution:_** Minimizes metabolic expenditure, allowing the system to redirect energy toward internal repair, digestion, cellular maintenance, and cognitive integration (memory consolidation). It prevents the exhaustion that comes from perpetual scanning and seeking.
 - **_Sub-Optimal Execution:_** Prolonged or premature satiation leads to systemic stagnation, atrophy, and vulnerability. If the system enters this state while macro-threats remain unaddressed, it fails to prepare for inevitable environmental shifts, dropping its defenses when it should be accumulating reserves.
- ****Dissolution Criteria:**** The natural decay of internal resources over time (the return of hunger, drop in temperature, or passage of time), or an external sensory input that signals a novel deficit, an approaching threat, or a high-value opportunity, reopening a seeking loop.

Shame

- ****Somatic Signature:**** A heavy, crushing downward pressure localized in the center of the chest, accompanied by a hollow sinking sensation in the stomach. Breathing becomes intensely restricted, shallow, and trapped in the upper chest; heart rate drops or becomes thin and brittle. Muscular tone undergoes an involuntary, global collapse—the spine slumps, the shoulders cave forward to protect the heart, the head drops, and the eyes are pinned to the ground, entirely unable to hold a forward gaze. The skin may feel alternately burning hot with exposure or icy cold with isolation.
- ****Generative Mechanics:**** The internal observer conducts a sweeping, global evaluation and concludes that the **_entire self_**—not merely a specific action—is fundamentally broken, toxic, and unfit for the group. It is triggered by the realization that a core personal flaw has been, or is about to be, exposed to the tribe, signaling an imminent and justified permanent exile from the collective perimeter.

- **Action Tendency:** Absolute behavioral containment, concealment of the face, and immediate withdrawal from the social field. The system is propelled to shrink its physical presence to zero, to disappear, or to actively hide from the gaze of others.

- **Action Teleology:**

- **Optimal Execution:** Acts as a radical, emergency social circuit breaker. By forcing the individual into total non-assertion and physical withdrawal, it prevents further provocative behaviors that would accelerate a permanent, violent eviction from the tribe, buying a narrow window for absolute submission and containment.

- **Sub-Optimal Execution:** Induces a toxic, permanent paralysis of the entire human system. Because the state targets the identity rather than a repairable behavior, it locks the individual in a recursive loop of self-loathing. This destroys the capacity for growth, breaks down immune and metabolic functioning, and paralyzes all forward agency, often leading to total existential surrender.

- **Dissolution Criteria:** A profound, explicit gesture of unconditional re-inclusion and validation from a trusted entity or the collective group, or a complete, internal decoupling of baseline self-preservation from the specific social framework that issued the judgment.

Shock

- **Somatic Signature:** An instantaneous, total freezing of the internal system. Breathing stops dead at the exact point of the cycle it was caught in; heart rate drops catastrophically for a single beat before surging into a rapid, thin, and brittle rhythm. Blood pressure plummets in the periphery, causing an immediate draining of warmth from the skin, leaving the face pale and cold. Muscular tone locks into absolute immobility—the jaw drops, the limbs freeze in mid-motion, and the eyes widen completely, fixing in a unblinking, dilated stare.

- **Generative Mechanics:** The system suffers a violent, unbuffered collision with data that completely demolishes the existing predictive framework. It occurs when an event manifests so rapidly or with such overwhelming force that the internal model cannot compress or categorize it, causing a temporary, systemic crash of the processing architecture.

- **Action Tendency:** Absolute behavioral stasis. The system drops all ongoing motor outputs, suppresses vocalization, and locks the perceptual apparatus onto the anomalous data point, refusing to allocate energy to any other action.

- **Action Teleology:**

- **Optimal Execution:** Acts as an immediate circuit breaker to protect structural integrity. By instantly halting all pre-programmed behavioral tracks, it prevents the organism from executing outdated or hazardous actions in a radically transformed environment. It forces the entirety of the system's processing power to focus exclusively on parsing the new, high-stakes reality.

- **Sub-Optimal Execution:** Prolonged, catatonic vulnerability. If the data is too devastating or the processing engine is too rigid to adapt, the freeze response outlives its tactical utility. The individual remains immobilized, mute, and completely defenseless in ground zero of a hazardous environment, unable to initiate basic survival protocols.

- **Dissolution Criteria:** The passing of the immediate sensory impact, followed by the slow, painful restructuring of the internal map to account for the new reality, allowing the system to drop its defensive freeze and resume localized motor execution.

Submission

- **Somatic Signature:** Rapid, profound down-regulation of the sympathetic nervous system paired with localized muscular collapse. Breathing shifts to a soft, shallow abdominal pattern; heart rate drops or stabilizes at a low-variability baseline. The skeletal structure undergoes an immediate downward and inward collapse—the head bows, the chin tucks to protect the throat, the shoulders roll forward to compress the chest, and eye contact is broken, shifting the gaze downward.
- **Generative Mechanics:** The system encounters an external entity or force that it calculates as overwhelmingly superior in power, status, or kinetic dominance. It occurs when a real-time assessment reveals that resistance, flight, or status negotiation would result in immediate, catastrophic structural destruction.
- **Action Tendency:** Exaggerated displays of non-threatening vulnerability, immediate compliance with external directives, and the complete suppression of personal agency or territorial claims. The system voluntarily down-regulates its internal status architecture to mirror the external hierarchy.
- **Action Teleology:**
- **_Optimal Execution:_** Serves as a critical survival pressure valve. By offering an unambiguous, physiological guarantee of non-threat to a dominant entity, it neutralizes aggressive behavior in the competitor, preserving the physical integrity of the self to fight or cooperate another day.
- **_Sub-Optimal Execution:_** Permanent or premature systemic collapse. If executed outside of genuine existential necessity, it erodes the internal observer's baseline self-efficacy, invites ongoing exploitation from the environment, and traps the organism at the bottom of the resource distribution chain where metabolic and reproductive options are severely restricted.
- **Dissolution Criteria:** The departure or neutralization of the dominant entity, an explicit signal of acceptance and integration from the superior force that allows the system to lift its defensive posture, or a structural shift in the environment that restores relative leverage to the self.

Tenderness

- **Somatic Signature:** A distinct, warm expansion and loosening of tension localized in the center of the chest, throat, and face. Breathing shifts to a smooth, deep, and rhythmic diaphragmatic pattern. Heart rate stabilizes with a high-variability, relaxed tone, delivering a sensation of internal calming. Muscular bracing throughout the body completely unlocks—the jaw relaxes, the hands open, the shoulders drop, and the facial muscles soften, smoothing the brow and eyes.
- **Generative Mechanics:** The system encounters a highly vulnerable, non-threatening target—such as an infant, an injured peer, or a fragile entity—that requires protection or

resources. It is triggered by the structural recognition that the self possesses a massive surplus of power or safety relative to the target, paired with zero threat vectors.

- **Action Tendency:** Gentle, low-velocity forward movement, physical caretaking (cradling, shielding, soothing), and vocal modulation (lowering pitch, softening volume). The system actively down-regulates its own kinetic power to match the fragility of the object.

- **Action Teleology:**

- **Optimal Execution:** Secures the survival of weak or developing nodes within the social architecture. By turning off aggressive, self-interested defense mechanisms, it allows for the seamless transfer of vital resources (warmth, food, protection) to the vulnerable target, cementing core bonds that preserve the collective lineage.

- **Sub-Optimal Execution:** Drops the system's perimeter defenses at an inappropriate time or toward an inappropriate object. If executed blindly, it leaves both the self and the vulnerable target completely exposed to predatory elements, or squanders finite systemic reserves on a parasitic or non-viable entity that cannot return utility to the network.

- **Dissolution Criteria:** The target achieves a state of safety and stability (allowing the system to return to baseline content), the target steps out of the vulnerability framework, or an external threat enters the perimeter, instantly shattering tenderness and converting it into defensive fear or protective rage.

Vitality and Vigor

- **Somatic Signature:** Global optimization of the physiological engine. Breathing is deep, rhythmic, and effortlessly expansive, utilizing the full lung capacity without tension. Heart rate is highly adaptive, presenting as a clean, strong pulse. Muscular tone is perfectly balanced—lithe, highly responsive, and entirely free of unnecessary bracing or chronic knots. A pervasive sensation of internal warmth, physical buoyancy, and systemic headroom dominates the body.

- **Generative Mechanics:** The internal system reaches a peak state of metabolic and cognitive reserves. This occurs when all primary biological loops (sleep architecture, nutrient assimilation, structural integrity) have been consistently closed with high efficiency, resulting in a massive net-surplus of cellular energy that exceeds current operational demands.

- **Action Tendency:** Proactive exploration, physical exertion, and environmental mastery. The system seeks out friction, eagerly taking on complex challenges, physical labor, or creative outputs simply to channel the kinetic surplus.

- **Action Teleology:**

- **Optimal Execution:** Positions the organism at peak evolutionary advantage. It allows the system to build robust structural buffers—such as stockpiling resources, strengthening social networks, and mastering new skills—while conditions are favorable, securing the perimeter before the next inevitable deficit phase.

- **Sub-Optimal Execution:** Leads to reckless over-extension and structural hubris. The sensation of infinite capacity can blind the observer to hidden wear, causing the individual to take on

unsustainable loads, disregard real boundaries, or burn through massive reserves on low-utility displays, setting the stage for a steep crash.

- ****Dissolution Criteria:**** The natural, gradual depletion of the energy surplus through sustained physical or cognitive output, or an abrupt external trauma or systemic infection that forces the body to immediately redirect its reserves into defense and repair.
